# Categorical model of noncommutative linear logic with subexponentials

 $\textbf{Definition 1.} \ \textit{A subexponential signature is an ordered quintuple:}$ 

$$\Sigma = \langle I, \leq, W, C, E \rangle,$$

where  $I = \{s_1, \ldots, s_n\}, \langle I, \leq \rangle$  is a preorder. W, C, E are subsets of I and  $W \cup C \subseteq E$ .

**Definition 2.** Noncommutative linear logic with subexponentials  $(SMALC_{\Sigma})$ , where  $\Sigma$  is a subexponential signature.

$$\frac{\Gamma, \Delta, !^{s} A, \Theta \Rightarrow B}{\Gamma, !^{s} A, \Delta, \Theta \Rightarrow A} \mathbf{ex}_{1}, s \in E$$

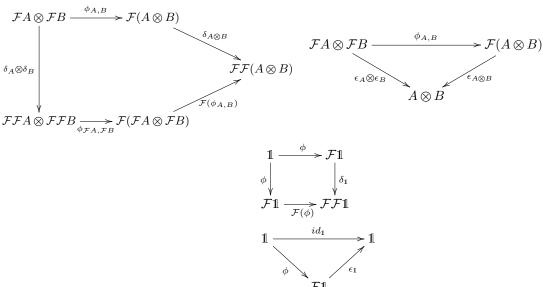

$$\frac{\Gamma, !^s A, \Delta, \Theta \Rightarrow B}{\Gamma, \Delta, !^s A, \Theta \Rightarrow A} \mathbf{ex}_1, s \in E$$

**Lemma 1.** Let  $A \Leftrightarrow B$ , then  $C[p_i := A] \Leftrightarrow C[p_i := B]$ 

*Proof.* By induction on C.

#### **Definition 3.** Monoidal comonad

A monoidal comonad on some monoidal category C is a triple  $\langle \mathcal{F}, \epsilon, \delta \rangle$ , where  $\mathcal{F}$  is a monoidal endofunctor and  $\epsilon : \mathcal{F} \Rightarrow Id_{\mathcal{C}}$  (counit) and  $\epsilon : \mathcal{F} \Rightarrow \mathcal{F}^2$  (comultiplication), such that the following diagrams commute:

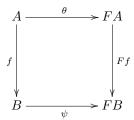

#### **Definition 4.** Biclosed monoidal category

Let C be a monoidal category. Biclosed monoidal category is a monoidal category with the following additional data:

- 1. Bifunctors  $\_$   $\circ$ — $, <math>\_$   $\rightarrow$   $\_$  :  $\mathcal{C}^{op} \times \mathcal{C} \rightarrow \mathcal{C}$ ;
- 2. Natural isomorphism  $\mathbf{curry}_{A,B,C} : Hom(A \otimes B, C) \cong (B, A \multimap C);$
- 3. Natural isomorphism  $\mathbf{curry}'_{A,B,C} : Hom(A \otimes B, C) \cong (A, C \multimap B);$
- 4. For each  $A, B \in Ob_{\mathcal{C}}$ , there are exist arrows  $ev_{A,B} : A \otimes (A \Rightarrow B) \to B$  and  $ev_{A,B}' : (B \Leftarrow A) \otimes A \to B$ , such that for all  $f : A \otimes C \to B$ :
  - (a)  $\Lambda_l \circ (id_A \otimes \mathbf{curry}(f)) = f$ ;
  - (b)  $\Lambda_r \circ (\mathbf{curry}'(f) \otimes id_A) = f$

**Definition 5.** Let F be endofunctor and  $A \in Ob\mathcal{C}$ , then a coalgebra of F is a tuple  $\langle A, \theta \rangle$ , where  $\theta : A \to FA$ .

Given coalgebras  $\langle A, \theta \rangle$  and  $\langle A, \psi \rangle$ , a homomorphism is a morphism  $f: A \to B$ , s.t. the diagram below commutes:

that is,  $Ff \circ \theta = \psi \circ f$ 

**Definition 6.** Subexponential model structure

Let  $\Sigma = \langle I, \leq, W, C, E \rangle$  be a subexponential signature and  $\mathcal{C}$  be a biclosed monoidal category, then a subexponential model structure is  $\langle \mathcal{C}, \{\mathcal{F}_s\}_{s \in I} \rangle$  with the following additional data:

- for all  $s \in I$ ,  $\mathcal{F}_s$  is a monoidal comonad;
- if  $s \in W$ , then for all  $A \in Ob(\mathcal{C})$ , there exists a morphism  $w_{A_s} : F_s A \to 1$ ;
- if  $s \in C$ , then for all  $A \in Ob(C)$ , there exists morphisms  $w_{Al} : F_sA \otimes A \otimes F_sA \to F_sA \otimes B$ and  $w_{Ar} : F_sA \otimes A \otimes F_sA \to B \otimes F_sA$ ;
- if  $s \in E$ , then for all  $A \in Ob(\mathcal{C})$ , there is an isomorpism,  $e_A : F_sA \otimes B \cong B \otimes F_sA$ ;
- if  $s_1 \in W$ ,  $s_2 \in I$  and  $s_1 \leq s_2$ , then there is a morphism  $w_{As_2} : F_{s_2}A \to \mathbb{1}$  for all  $A \in Ob(\mathcal{C})$  and ditto for E and C;
- Let  $\bigotimes_{s\in J,i=0}^n F_s A$ , where  $J\subset I$ , and  $s'\in I$ , s.t.  $s\geq s'$  for all  $s\in I'$ ; Then there exists morphism a morphism  $\theta\bigotimes_{s\in J,i=1}^n F_{sj}A_i:\bigotimes_{s\in J,i=0}^n F_s A\to F_{s'}(\bigotimes_{s\in J,i=0}^n F_s A)$ , such that  $\bigotimes_{s\in J,i=1}^n F_{sj}A_i,\theta\bigotimes_{s\in J,i=1}^n F_{sj}A_i$  is a coalgebra on  $F_s$ .

**Definition 7.** Let  $\langle \mathcal{C}, \{\mathcal{F}_s\}_{s\in I} \rangle$  be a subexponential model structure for subexponential signature  $\Sigma = \langle I, \leq, W, C, E \rangle$ . Let  $v: Tp \to Ob(\mathcal{C})$  be a valuation map. Then the interpretation function  $[\![.]\!]$  is defined as follows:

- (1) [1] = 1
- $(2) \quad \llbracket A \backslash B \rrbracket = \llbracket A \rrbracket \multimap \llbracket B \rrbracket$
- $(3) \quad \overline{\llbracket A/B \rrbracket} = \overline{\llbracket A \rrbracket} \smile \overline{\llbracket B \rrbracket}$
- $(4) \quad \llbracket A \bullet B \rrbracket = \llbracket A \rrbracket \otimes \llbracket B \rrbracket$
- $(5) \quad \llbracket !_s A \rrbracket = F_s \llbracket A \rrbracket$

**Theorem 1.** The following statements are equivalent:

- $SMLC_{\Sigma} + (cut) \vdash \Gamma \Rightarrow A$
- $SMLC_{\Sigma} \vdash \Gamma \Rightarrow A$
- $\exists f, f : \llbracket \Gamma \rrbracket \to \llbracket A \rrbracket$

Proof.

- $(1) \Rightarrow (2)$ : cut elimination.
- $(2) \Rightarrow (3)$ : Soundness:

$$\frac{f: \Gamma \otimes (F_s A \otimes B \otimes F_s A) \otimes \Delta \to C}{f \circ (id_{\Gamma} \otimes c_A{}^l_s \otimes id_{\Delta}): \Gamma \otimes (F_s A \otimes B) \otimes \Delta \to C}$$

$$\frac{f: \Gamma \otimes (F_s A \otimes B \otimes F_s A) \otimes \Delta \to C}{(id_{\Gamma} \otimes c_A{}^r_s \otimes id_{\Delta}) \circ f: \Gamma \otimes (B \otimes F_s A) \otimes \Delta \to C}$$

$$\frac{f: \Gamma \otimes (\Delta \otimes F_s A) \otimes \Theta \to B}{(id_{\Gamma} \otimes (id_{\Delta} \otimes e_{A_s}) \otimes id_{\Theta}) \circ f: \Gamma \otimes (F_s A \otimes \Delta) \otimes \Theta \to B}$$

$$\frac{f: \Gamma \otimes (F_s A \otimes \Delta) \otimes \Theta \to B}{(id_{\Gamma} \otimes (id_{\Delta} \otimes e_{A_s}) \otimes id_{\Theta}) \circ f: \Gamma \otimes (\Delta \otimes F_s A) \otimes \Theta \to B}$$

$$\frac{f: \Gamma \otimes (F_s A \otimes \Delta) \otimes \Theta \to B}{(id_{\Gamma} \otimes (id_{\Delta} \otimes e_{A_s}) \otimes id_{\Theta}) \circ f: \Gamma \otimes (\Delta \otimes F_s A) \otimes \Theta \to B}$$

• Completeness:

Definition 8.

## 1 Concrete model

**Definition 9.** Quantale A quantale is a triple  $\langle A, \bigvee, \cdot \rangle$ , such that  $\langle A, \bigvee \rangle$  is a complete lattice and  $\langle A, \cdot \rangle$  is a semigroup. A quantate is called unital, if  $\langle A, \cdot \rangle$  is a monoid.

It is easy to see, that any (unital) quantale is a residual (monoid) semigroup. We define divisions as follows:

1. 
$$a \setminus b = \bigvee \{c \mid a \cdot c \leqslant b\}$$

2. 
$$b/a = \bigvee \{c \mid c \cdot a \leq b\}$$

**Definition 10.** Let  $\langle A, \bigvee, \cdot \rangle$  be a quantale. The center of a quantale is the set  $Z(Q) = \{a \in Q \mid \forall b \in Q, a \cdot b = b \cdot a\}$ 

**Definition 11.** An open modality on quantale Q is a map  $I: Q \to Q$ , such that

1. 
$$I(x) \le x$$
;

2. 
$$I(x) = I(I(x));$$

3. 
$$x \leq y \Rightarrow I(x) \leq I(y)$$
;

4. 
$$I(x) \cdot I(y) = I(I(x) \cdot I(y))$$
.

#### Lemma 2.

Let  $\langle A, \bigvee, \cdot \rangle$  be a quantale and  $I: Q \to Q$  is an open modality on Q, then  $I(x) \cdot I(y) \leq I(x \cdot y)$ .

Proof.

$$I(x) \cdot I(y) \leqslant x \cdot y$$
, then  $I(I(x) \cdot I(y)) \leqslant I(x \cdot y)$ , but  $I(x) \cdot I(y) \leqslant I(I(x) \cdot I(y))$ . Thus,  $I(x) \cdot I(y) \leqslant I(x \cdot y)$ .

**Definition 12.** An open modality is called central, if  $\forall a, b \in Q, I(a) \cdot b = b \cdot I(a)$ .

**Definition 13.** An open modality is called weak idempotent, if  $\forall a, b \in Q, I(a) \cdot b \leqslant I(a) \cdot b \cdot I(a)$  and  $b \cdot I(a) \leqslant I(a) \cdot b \cdot I(a)$ .

**Definition 14.** An open modality is called unital, if  $\forall a \in Q, I(a) \leq e$ .

**Lemma 3.** Let I be an interior on some unital quantale  $\langle Q, \bigvee, \cdot, e \rangle$ . Then, if I is unital and weak idempotent, then I is central.

```
Proof. b \cdot I(a) \leqslant Right weak idempotence I(a) \cdot b \cdot I(a) \leqslant Unitality I(a) \cdot b \cdot I(e) \leqslant Identity I(a) \cdot b \leqslant Left weak idempotence I(a) \cdot b \cdot I(a) \leqslant Unitality e \cdot b \cdot I(a) \leqslant Identity b \cdot I(a) Hence, b \cdot I(a) = I(a) \cdot b
```

#### Proposition 1.

Let Q be a quantale and  $S \subseteq Q$  a subquantale, then  $I: Q \to Q$ , such that  $I(a) = \bigvee \{s \in S \mid x \leq a\}$ , is an open modality.

#### Proposition 2.

```
Let Q be a quantale and S_1, S_2 \subseteq Q, such that S_1 \subseteq S_2.
Then I_1(a) \leq I_2(a).
```

Proof.

Let 
$$a \in Q$$
, so  $\{s \in S_1 \mid s \leqslant a\} \subseteq \{s \in S_2 \mid s \leqslant a\}$ , so  $\bigvee \{s \in S_1 \mid s \leqslant a\} \subseteq \bigvee \{s \in S_2 \mid s \leqslant a\}$ .  
Thus,  $I_1(a) \leqslant I_2(a)$ .

#### Proposition 3.

Let Q be a quantale and  $S \subseteq Q$  a subquantale, then the following operations are open modalities:

```
1. I_{z}(a) = \bigvee \{ s \in S \mid s \leq a, s \in Z(Q) \};

2. I_{1}(a) = \bigvee \{ s \in S \mid s \leq a, s \leq 1 \};

3. I_{idem}(a) = \bigvee \{ s \in S \mid s \leq a, \forall b \in Q, b \cdot s \vee s \cdot b \leq s \cdot b \cdot s \};

4. I_{z,1}, I_{z,idem}, I_{1,idem}, I_{z,1,idem}.
```

*Proof.* Immediatly.  $\Box$ 

#### Proposition 4.

1. 
$$\forall a \in Q, I_{1,idem}(a) \leq I_z(a)$$
.

2. 
$$\forall a \in Q, I_{z,1,idem} = I_{1,idem}(a)$$

*Proof.* Follows from Lemma 3.

## Proposition 5.

1. 
$$I_z(a) \vee I_1(a) \vee I_{idem}(a) \leq I(a)$$

2. 
$$I_{z,1,idem} \leq I_{z,1}(a) \wedge I_{z,idem}(a)$$

#### Lemma 4.

**Lemma 5.**  $I_1(a_1) \cdot I_2(a_2) \leqslant I'(I_1(a_1) \cdot I_2(a_2))$ , where  $I' \leqslant I_i$ , i = 1, 2.

### Lemma 6.

 $I_1, \ldots, I_n$  are open modalities, thus:  $I_1(a_1) \cdot I_2(a_2) \cdot \cdots \cdot I_n(a_n) \leq a$ , then  $I_1(a_1) \cdot \ldots \cdot I_n(a_n) \leq I'(a)$ , where  $I' \leq I_i$  for all i.

 $\square$ 

Theorem 2.  $\Gamma \to A \Rightarrow \Gamma \models A$
